

## **png2ico - PNG to icon converter (Linux, Unix, GNU, Windows, ...)**

Converts PNG files to Windows icon resource files. If you're looking for a program to create a `favicon.ico` for your website, look no further. If you need instructions or don't even know what a *favicon* is, check out my short tutorial on [how to create and install a favicon.ico](#).

The program is extremely simple to use. To create a `favicon.ico` that contains a logo in the resolutions 16x16 and 32x32 (an icon can contain multiple images of different sizes, but a single 16x16 image is enough for a favicon), you would use a command like the following:

```
png2ico favicon.ico logo16x16.png logo32x32.png
```

### **Download**

If you use Windows, then download the following package that contains a ready-to-run executable and documentation:

[png2ico-win-2002-12-08.zip](#) (90K)

**ATTENTION! This is a console application without a Graphical User Interface (i.e. no icons, no mouse)! You have to launch it either from the console or via Start/Run. You can NOT just double-click it.**

On other platforms, you will have to compile the program yourself. The following package contains the source code and documentation:

[png2ico-src-2002-12-08.tar.gz](#) (26K)
