

# TinyWeb Server

---

 [ritlabs.com/en/products/tinyweb/](https://ritlabs.com/en/products/tinyweb/)

TinyWeb is an extremely small (executable file size is 53K), simple (no configuration other than through the command line) and fast (consumes a minimum of system resources) Win32 daemon for regular (TCP/http) and secure (SSL/TLS/https) web-servers.

This program is FREE for commercial and non-commercial use. The only restriction is that the copyright holder must be acknowledged for the development of this code. See the LICENCE file for more details. As this has been in essence an unpaid effort there is no guarantee of support (you get what you pay for :-)), however we do perform a limited amount of consulting.

TinyWeb was written by Maxim Masiutin using Delphi. Source code is also provided. This program may be freely distributed, provided the distribution package is not modified. No person or company may charge a fee for the distribution of this program without written permission of the copyright holder.
